This cover picture illustrates the spontaneous assembly of catenanes via a kinetically controlled macrocyclization through a crown ether cavity. The metal-free active template reaction enables the straightforward synthesis of structurally simple catenanes that are inaccessible via conventional threading or clipping routes. Further information can be found in the Research Article by David A. Leigh and co-workers (DOI: 10.1002/anov.70004). Image Credit Anna Tanczos (SciComm Studios).
